## Maidstone Bus Station Case Study

Gutterworks Ltd was selected to supply a stunning array of different coloured panels, each designating a bus parking bay, as part of a large project to refurbish and improve the visual appeal of the station.

A Skyline fascia and soffit system was specified and supplied, comprising of 3mm thick Aluminium panels, polyester powder coated in a total of sixteen different, primarily non-standard RAL colours. The flexibility and bespoke possibilities of this range lent itself to the project, with the panels installed around and over the pillars separating each bay and achieving a gradual transition of colour throughout the length of the chamber. Each bent and flat profile was carefully fabricated to the customer's specification, with on-site measurements taken by Gutterworks, and the sections cut to size as per the required dimensions.

*Before*

The complexities of the project required Gutterworks to work closely with the manufacturer, Alumasc Water Management Solutions, as each profile had to be cut exactly. The specification of multiple bespoke colours also posed a unique challenge, as many of these were not readily stocked and extra care had to be taken to ensure every section was powder coated in the correct colour.

Despite these challenges, Gutterworks successfully navigated the bespoke profile and colour requirements to help achieve a modern, brighter station as intended. Gutterworks accurately handled the needs of the project, from assisting with initial site measurements and engaging with the design specifications through to the beginning of the fabrication process, focusing on precision and aesthetics for a great end result.
